```
This sequence represents an immunogenic polypeptide, SodC, which is capable of eliciting the production of antibodies against L.

intracellularis when administered to an avian or porcine animal. This polypeptide can be used in a vaccine composition for the prophylaxis or treatment of intestinal infection of an animal by Lawsonia. The DNA concolled produced in a vaccine vector such that the SodC polypeptide may be used in a vaccine vector such that the SodC polypeptide is expressible at a level sufficient to confer immunity against Lawsonia. The polypeptide is useful for diagnosing infection of a correct or not the animal has suffered from a past infection or is currently infected with L.

CC intracellularis or a microorganism that is immunologically cross-reactive confer. This is done by contacting whole serum, blood lymph nodes, ileum, caecum, small intestine, large intestine, faeces or rectal swab derived from the animal with the immunogenic polypeptide or an antibody raised against it. Probes derived from the Lawsonia DNA are useful for detecting L intracellularis or related microorganisms by hybridization. The SodC polypeptide is useful in the preparation of a medicament for the polypeptide prophylaxis of porcine proliferative enteropathy (PPE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Acinetobacter baumanni proteins and nucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for plants.

The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.
                                             The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant expression vector; transcription regulatory element; Klebsiella pneumoniae protein; antibacterial; Vaccine.

The sequence is that of the 20kD Brucella abortus copper-zinc superoxide dismutase (CuZnSOD) which is used as part of a method for detecting B. abortus infection in animals, in particular Bovine brucellosis. The method can distinguish between animals which have a natural infection and those which have been vaccinated. CuZnSOD or a segment effective as an antigenic determinant is combined with a body fluid sample and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino acids. Also described: (I) an assay for the detection of a particular g protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or solidity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for detecting the gressence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for treathing immune-related diseases, growth-related diseases, cell regeneration-related disease, immunological-related cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        G protein-coupled receptor, GPCR, antigenic peptide, gene therapy, G protein-coupled receptor modulator; antibody; immune-related disease; growth-related disease; call regeneration-related disease; AIDS; cancer; immunological-related cell proliferative disease; autoimmune disease; Alzheimer's disease; atherosclerosis, infection; osteoarthritis; allergy; osteoprosis; cardiomyopathy; inflammation; Crohn's disease; diabetes; graft versus host disease; Parkinson's disease; multiple sclerosis; pain; psoriasis; anxiety; depression; schizophrenia; dementia; memory loss; mental retardation; epilepsy; asthma; tuberculosis; obesity; nausea; hypertension; hypotension; renal disorder; rheumatoid arthritis; trauma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid (1) from Ashbya gossypii comprising: (a) 63 fully defined nuclectide sequences (ABL60128-ABL60157) given in the specification; or (b) a fragment of (a). Cells that express (1) show altered production of fine chemicals, particularly: (a) organic, amino or fatty acids; (b) purine and pyrimidine bases; (c) nucleotides or nucleosides; (d) lipids; (e) diols; (f) carbohydrates; (g) aromatic compounds; (h) vitamins (particularly riboflavin); (l) cofactors; and (j) enzymes. These chemicals are useful in the food, fodder, cosmetic and pharmaceutical industries. (I) are also useful for identification and characterisation of A. gossypii and related organisms
diseases, or autoimmune diseases, e.g. AIDS, Alzheimer's disease, atherosclerosis, bacterial, fungal, protozoan or viral infections, osteoarchitis, carediomyopathy, chronic and acute inflammation, allergies, cancer, carediomyopathy, chronic and acute disease, Parkinson's disease, multiple sclerosis, pain, psoriasis, disease, Parkinson's disease, multiple sclerosis, pain, psoriasis, anxiety, depression, schizophrenia, dementia, mental retardation, memory loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis. ABZ42523 to ABZ42869 encode GPCR proteins given in ABP84575 to ABZ42523 to ABZ42869 encode exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid from Ashbya gossypii, useful, when modulated, for producing fine chemicals, e.g. amino acids, encodes stress-associated
                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enterohemorragic Escherichia coli 0157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Flavobacterium; sulphated fucogalactan digesting enzyme; polysaccharide; sulphated fucogalactan; structural analysis; sugar engineering reagent; sulphated fucogalactan degradation; cancer; viral infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel enterohaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enterohemorragic Escherichia coli O157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
and as primers and probes for detection and amplification of (I). The encoded polypeptides (ABB77446-ABB7745) are useful as markers for encoded polypeptides (ABB77446-ABB7745) are useful as markers for repeints in genomic mapping and for functional studies on proteins and for evolution or protein structure investigations. Modulating activity of (I) may improve yields, production and/or efficiency of production of fine chemicals by A. gossppi. Particularly the cells show a more robust response against stress, so viability and productivity are improved, particularly in large-scale bioreactors.                                                                  genes for muscarinic acetyl:choline receptors - for drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying agonists of G protein-coupled receptors (GPCRs) for use in disease treatment, comprises contacting candidate compounds with versions of GPCRs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to G protein-coupled receptors (GPCRs) for which the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCRs.
                                                                                                                                                                                     Cell lines producing this MAR is useful in screening for drugs with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                   The present invention describes polypeptides (P) derived from digest mulphated fuogalactans. Also described. (1) polypeptides with digest sulphated fuogalactans. Also described. (1) polypeptides with similar activity derived from (P) by addition, deletion and/or similar activity derived from (P) by addition, deletion and/or substitution of one or more amino acid residues, or at least 30% homologus to them; (2) nucleic acids (1) encoding the polypeptides; (3) expression vectors containing the nucleic acids; (4) hosts transformed by these vectors; (5) a method for the preparation of the polypeptides by culture of the transformed hosts; (6) sulphated fuogalactan digestion products obtained by polysaccharide digestion using the polypeptides; (7) a screening method for genes encoding polypeptides having sulphated fuogalactan digesting activity, using nucleic acids (1) or their partial sequences as probes; and (8) a method for the structural analysis of polysaccharides, and for the preparation of the structural analysis of polysaccharides, and for the preparation of sulphated fuogalactan degradation products for use as antigens for the preparation of alphated fuogalactan degradation products for use as antigens for the preparation of antibodies for the diagnosis of diseases including cancer and viral infection. The present sequence represents Flavobacterium sfgA, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                     Sulfated fucogalactan digesting enzyme of Flavobacterium origin for polysaccharide structural analysis and engineering and preparation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This sequence is the human cholinergic receptor, muscarinic 5 (CHRM5) protein. The invention relates to a polymorphic variant of the CHRM5 gene sequence. The polymorphic sequence is useful to genotype or haplotype the CHRM5 gene, to predict a haplotype pair for the CHRM5 gene, and for identifying an association between a trait (such as a clinical response to a drug targeting CHRM5). It is also useful in gene therapy in patients who lack the CHRM5 isogene or have only one copy of it, and in assays to measure the binding affinities of one or more candidate drugs targeting CHRM5. The DNA sequence is used in the treatment of disorders affected by expression or function of a novel CHRM5 isogene of the invention. The protein encoded by the CHRM5 variant is useful to identify drugs which target the CHRM5 polymorphic variant protein. Antibodies against the protein can be used to neutralise the CHRM5 isoform activity expressed in a individual, and is useful in detection of CHRM5 in immunocycochemical, immunobilatochemical and immunofluorescence. A composition containing a genotyping oligonucleotide for detecting a polymorphism in the CHRM5 gene is used to detect novel CHRM5 polymorphisms of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated polynucleotide encoding the cholinergic receptor, muscarinic 5 (CHRMS), used to genotype/haplotype the CHRMS gene, and to identify an association between a trait and a polymorphism, comprises novel
                                                                                                                                                                                                                                                                                                                                                                                          CHRM5; human; cholinergic receptor muscarinic 5; polymorphic variant;

```
The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its fragment. The invention is useful in drug screening assays. The molecules of the invention are useful in studying the expression and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic condidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual candidate drugs to treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual useful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genotyping and/or haplotyping the CHRM5 gene in an individual. The present amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                   Human, cholinergic receptor muscarinic 5, CHRM5; genotyping; haplotyping,
single nucleotide polymorphism; SNP; chromosome 15q26.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel cholinergic receptor, muscarinic 5 polynucleotide useful therapeutically and in screening for candidate drug to treat diseases related to the receptor activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human CHRMS protein of the invention. This sequence is human CHRMS gene located on chromosome 15q26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ٠,

The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or list fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its polymorphic variant of a reference sequence for a CHRM5 cDNA or its considerable invention are useful in studying the expression and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic treatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual has one of the hablotypes or one of the hablotype pairs. The invention is also useful in genotyping and/or haplotyping the CHRM5 pariant protein of the invention which shows represents the human CHRM5 variant protein of the invention which shows in the specification but is derived from the wild-type human CHRM5 protein the specification but is derived from the wild-type human CHRM5 protein can be considered to the specification but is derived from the wild-type human CHRM5 protein can be considered to the specification but is derived from the specification.
                                                                                                                                                         Human; cholinergic receptor muscarinic 5; CHRM5; genotyping; haplotyping;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel cholinergic receptor, muscarinic 5 polynucleotide useful therapeutically and in screening for candidate drug to treat diseases related to the receptor activity.
                                                                                                                   Human cholinergic receptor, muscarinic 5 (CHRMS) variant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Denton RR, Nandabalan K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 532;

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABPB2019 to ABPB3619) of 12-24 amino acids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or avoidity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR, and in the production of specific presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for detecting an autibodies are useful for diagnosing and designing drugs for GPCRs, and antibodies are useful for diagnosing and designing drugs for

The invention relates to a method of identifying a compound useful in the treatment of AIDS (acquired immunodeficiency syndrome) or an HIV (human immunodeficiency virus) related disorder. The invention involves assaying the ability of a test compound to modulate the activity or expression of 26 human proteins. These proteins and nucleic acids encoding them (ADE402-ADE40473) are differentially expressed in tissues relating to AIDS or an HIV-related disorder compared to their expression in normal tissues. The invention also relates to the use of the compounds tidentified to modulate viral replication in a cell and to treat a patient with AIDS or an HV-related disorder. The invention further discloses methods for the diagnostic evaluation and prognosis of various HIV-celated disorder. The invention further discloses method sich conditions. The modulatory compounds identified using the method of the invention and be small organic molecules.

The invention are useful in diagnosing, preventing or treating AIDS or HIV-related disorders. The present sequence represents a human protein compounds is differentially expressed in AIDS or HIV-related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a compound capable of diagnosing, preventing or treating AIDS or an HIV-related disorder comprises assaying the ability of the compound to mediate e.g. 1414, 1481 or 1553 nucleic acid expression or polypeptide activity.
                                                                                                                                                                                    AIDS; acquired immunodeficiency syndrome; human immunodeficiency virus; HIV-related disorder; differential expression; drug screening; viral replication modulation; diagnosis; prognosis; predisposition; anti-HIV; gene therapy; antisense therapy; human; muscarinic acetylcholine receptor M5; receptor.
                                                                                                                                           Human muscarinic acetylcholine receptor M5 (gene ID 126) protein.

MS nucleotides and polypeptides play a role in or function in acetylcholine signalling pathways which are involved in regulation of metabolic function. The MS modulators of the invention may have immunomodulator, anorectic or anabolic activity. The invention is useful for identifying a compound capable of treating a metabolic disorder such as aberrant food intake, obesity, cachexia, or anorexia. The present sequence is that of the human MS protein which was used during the identification of the MS modulators of the invention.

The invention relates to human and mouse G protein-coupled receptors

(GPCRs) and nucleic acids encoding them. The invention also relates to

sequences at least 90% identical to the GPCR proteins and nucleic acids

of the invention; methods of treating, preventing or diagnosing diseases

compounds useful in the treatment of GPCR-related disease; a transgenic

mouse comprising a GPCR gene of the invention; a mouse comprising a

mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived

from the transgenic mice; kits comprising several mice, each of which has

mutation in a different GPCR gene of the invention, and kits comprising

comprising a GPCR gene of the invention, and kits comprising

probes which hybridise to GPCR polyunclectides of the invention. The

invention further discloses variants of the GPCR polypeptides and vectors

comprising a GPCR nucleic acid. The GPCR polypeptides and vectors

comprising a GPCR nucleic acid. The GPCR polypeptides and vectors

comprising a GPCR nucleic acid. The GPCR polypeptides and vectors

comprising a GPCR nucleic acid. The GPCR polypeptides and vectors

comprising a GPCR nucleic acid. The GPCR polypeptides and vectors

comprising a GPCR nucleic acide and proteins may

be used in the diagnosis, treatment or prevention of a wide variety of

diseases including neurological disorders (e.g., Alzheimer's disease,

depression, diabetic neuropeathy, Parkinson's disease or schizophrenia);

disorders of the adrenal gland, disorders of the colon or intestine

c (e.g., Crohn's disease, diarrhoea, food poisoning or irritable bowel

syndrome); cardiovascular disorders (e.g., angina, cardiac arrhythmia or

                                                                                                                                                                    from the transgenic mice; kits comprising several mice, each of which has a mutation in a different GPCR gene of the invention; and kits comprising probes which hybridise to GPCR polymcleotides of the invention. The invention in different GPCR polymcleotides of the invention. The cromprising a GPCR mucleic acid. The GPCR polypeptides and vectors comprising a GPCR mucleic acid. The GPCR nucleic acids and proteins may comprising a GPCR mucleic acid. The GPCR nucleic acids and proteins may diseases including neurological disorders (e.g., Alzheimer's disease, disorders of the adrenal gland; disorders of the colon or intestine of disorders of the adrenal gland; disorders of the colon or intestine (e.g., Crohn's disease, diarrhoea, food poisoning or irritable bowel syndrome); cardiovascular disorders (e.g., angina, cardiac arrhythmia or mycardial infraction); muscular disorders (e.g., autoimmune disorders or maemia or leukaemia); immune disorders (e.g., autoimmune disorders or ALDS); bone and joint disorders (e.g., osteoarthritis, rheumatoid carthritis, gond or osteoporosis); metabolic or nutritive disorders (e.g., obesity, enzyme deficiency-related diseases) and disorders of the kidney, liver, lung, breast, ovary, cobesity, enzyme deficiency-related diseases) and disorders of the kidney, liver, lung, breast, ovary, cuterus, prostate, testis, skin, stomach, pancreas, spleen, thymus and thyroid (e.g., cancers). The present sequence represents a GPCR of the invention. Note: The full sequence data for this patent did not form part of the form of the colon of the printed specification, those sequences not shown were obtained in a colon of the printed sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                        The invention relates to human and mouse G protein-coupled receptors (GPCRs) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to, the GPCR proteins and nucleic acids of the invention; methods of treating, preventing or diagnosing diseases associated with GPCRs of the invention; methods of screening for compounds useful in the treatment of GPCR. related diseases; a transgenic mouse comprising a GPCR gene of the invention; a mouse comprising a mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Flavobacterium; sulphated fucogalactan digesting enzyme; polysaccharide; sulphated fucogalactan; structural analysis; sugar engineering reagent; sulphated fucogalactan degradation; cancer; viral infection.

                                                                                                                                                  New human nucleic acid associated proteins (NAAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant NAAP expression e.g. cancer, AIDS, atherosclerosis, epilepsy, or
                              Gandhi AR;
                                                                                                                                                                                                                                 The present invention relates to novel human nucleic acid associated protein (NAAP) (1, ADC37534-ADC37593) and their coding sequences {}}. The NAAPs and their coding sequences are useful in diagnosing, treating and preventing diseases or conditions accided with the decreased expression or over expression of NAAP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) disorders, or infections. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of

```
The sequence is that of telomerase protein plo5, it can be used to screen for agents, e.g. antibodies, that modulate binding of human telomerase to treat conditions such as cancer, restenosis, inflammation, myocardial infarction, glomerulonephritis, transplant rejection and infections (e.g. with human immundeficiency virus), while those that are agonists can be used to extend the life of proliferation-restricted cells, especially normal somatic cells, e.g. in cases of hypersensitivity or atrophy, also to improve production of recombinant proteins by maximising cell density and survival and expansion of precursor cells being used for bone marrow transplants. They may also be used for diagnosis. Other uses of telomerase proteins are isolation, enrichment and concentration of telomerase RNA or proteins, as immunogens, in therapy; as reagent where ascent oligonucleotides of known structure are needed (e.g. for tagging tolerance. The agents and for regulating cell growth/density specific, e.g. they are selective for cancer cells without harming somatic cells
                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding human telomerase protein p105 or its fragments - used for therapeutic modulation of telomerase activity and for screening for potential modulators of telomerase-target binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

isolated from human cells or expressed in host cells using native plos cDNA (see AAV05369), or optimised synthetic sequences (see AAV05370-72). The invention provides methods relating to human telenerase and related nucleic acids, including the submit proteins pl40, pl05, p48 and p43. The invention also provides isolated telomerase hybridisation probes and primers capable of specifically hybridising with the telomerase gene, telomerase specific binding agents such as specific antibodies, and methods of making and using the subject compositions in diagnosis (e.g. genettic hybridisation screens for telomerase transcripts), therapy (e.g. genet therapy to modulate telomerase gene expression) and in the biopharmaceutical industry (e.g. reagents for screening chemical biopharmaceutical industry (e.g. reagents for screening chemical instruction, glomerulonnof cancer, restenosis, inflammation, myocardial infarction, glomerulonephritis, transplant rejection or infections (e.g. with HIV). Telomerase proteins can also be used in the isolation, enrichment and concentration of telomerase RNA proteins, as immunogens, in therapy, for regulating cell growth/density tolerance and corporation or prevention as substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This protein comprises the pl05 subunit of human telomerase. pl05 can be
                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding human telomerase proteins or their fragments useful for therapeutic modulation of telomerase activity and for screening for potential modulators of telomerase-target binding.
                                                                                                                                                                                                                                                                                                         WPI; 1998-101043/09.

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide complementary to the
complementary strand of a polynucleotide which comprises one of the 5602

nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 3'-end sequence, where the
coligonucleotide comprises a 1-bast 15 nucleotides and the compination of
the 5'-end sequence/3'-end sequence is selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
gene therapy. The primer sets can be used in antisense therapy and in
gene therapy. The primer sets can be used in antisense therapy and in
gene therapy. The primer sets can be used in antisense therapy and in
gene therapy. The primer sets can be used in antisense therapy and in
gene therapy. The primer sets can be used in antisense therapy and in
centarious and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
che full-length cDNAs. The primers are also weeful for the

RESULT 25 ABO53053 10-OCT-2003 (first entry)

Human putative spliceosome associated protein (SAP) #29.

RNP complex; RNA affinity substrate; RNP assembly sequence; splicescomal complex; hnRNP complex; mRNA export complex; splicescomal complex; hnRNP complex; mRNA export complex; complex; telomerase complex; fragile X protein complex; reverse transcriptase complex; gene splicing complex. spliceosome associated protein; ribonucleoprotein;

Homo sapiens

```
The invention relates to forming (M1) an isolated ribonucleoprotein (RNP) complex (C), involves contacting an RNA affinity substrate (S) comprising CC an RNB assembly sequence (AS) and an affinity tag, with a protein mixture CC to permit formation of (C) on AS, subjecting (C) to chromatographic corpusation, and subjecting (C) to affinity selection, where the affinity corpusation, and subjecting (C) to affinity selection, where the affinity car ag (e.g. bacteriophage M2 coat protein in a fusion protein with E. coli maltose binding protein) binds to an affinity matrix. Also included are an isolated spliceosome preparation (isolated by (M1)), a RNA comprising can RNB complex binding site and at least one phage coat protein crecognition site, a nucleic associated with abnormal RNP complexes (by subject having a sample of cells from a subject, purifying RNP complexes (by cotabining a sample of cells from a subject, purifying RNP complexes from complexes of one or more proteins, and normalising the purified RNP complexes of one or more proteins, and normalising the complex in the subject (M1); assetul for forming an isolated RNP complex, an RNA editing complex, an explication complex, an analyse complex, an analyse complex, an analyse complex, an analyse complex, an analyse complex, an adapted sassay for determining whether a subject having a disorder associated with abnormal RNP complexes (M1) is useful for treating a subject having a complex, a reverse transcriptase complex or a gene splicing complex. The present sequence represents a putative novel human complexes. The present sequence represents a putative novel human complexes associated protein (SAP) isolated by the methods of the invention. Note: The preent sequence is not shown in the specification complexed protein complexed by the methods of the specification of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolating ribonucleoprotein complex, by contacting RNA affinity substrate having ribonucleoprotein assembly sequence and affinity tag, with protein mixture, subjecting complex formed to chromatography, affinity selection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Saccharomyces cerevisiae; complementary peptide; peptide identification;

                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher evararyotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents durgs for drug discovery and as lead ligands for drug design and sevelopment. The present sequence is a complementary peptide from Saccharomyces cerevisiae
                                                                                                                                                                                                                                                                                                                Identifying complementary peptides by analysis of protein and nucleotide sequence databases, useful in drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a vehicle-peptide molecule (I) or its multimers. (I) can have antiinflammatory, antitumour, immunosuppressive, cytostatic, antirheumatic, antiatabetic, ophthalmological, antianaemic, antirheumatic, antiatheumatic, dentinifertility, haemostatic, dermatological and neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, theuristic and neurological degenerative diseases, tumour growth, cancer, infertility, and neurological degenerative diseases, (I), comprising medakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency expense megakaryocyte/platelet deficiency expense megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency expense megakaryocyte/platelet deficiency expense megakaryocyte/platelet deficiency expense megakaryocyte/platelet deficiency expense megakaryocyte/platelet deficiency expense of the megakaryocyte/platelet deficiency expense of the megakaryocyte/platelet deficience expect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytostatic; cancer; gene therapy; DGI-2; DGI-5; DGI-7; DGI-9; Hras; leptin; VEGF: vascular endothelial growth factor receptor; VEGF-R1; VEGF-R2; VEGF-R3; FIT1; FMS-related tyrosine kinase 1; FLK1; KDR; KInase insert domain protein receptor; EGFR; epidermal growth factor; FGFR1; fibroblast growth factor; Tie-1.
